La següent llista inclou tots els tàxons observats per l'autor en el territori del Moianès i àrees properes (en vermell en el mapa adjunt al final del text) fins al moment, tan espontanis com subespontanis o naturalitzats.

Alguns grups complexos resten encara en procés de revisió (gèneres *Asplenium*, *Festuca*, *Rubus*, *Hieracium* p.p., *Ophrys*...). També s'han mantingut espècies àmplies (a nivell de grup) en els casos en que encara falta una revisió definitiva de quins tàxons a nivell infraespecífic són presents al territori. Cal també fer esment del caràcter no exhaustiu de les espècies al·lòctones recollides, especialment de les considerades subespontànies.

Pel que fa a la nomenclatura i taxonomia s'ha seguit en la majoria dels casos la Flora Manual dels Països Catalans (Bolòs et al., 2005). L'índex de raresa utilitzat segueix la següent escala: C: comú; F: freqüent; R: rar; RR: molt rar.
